DISCLAIMER

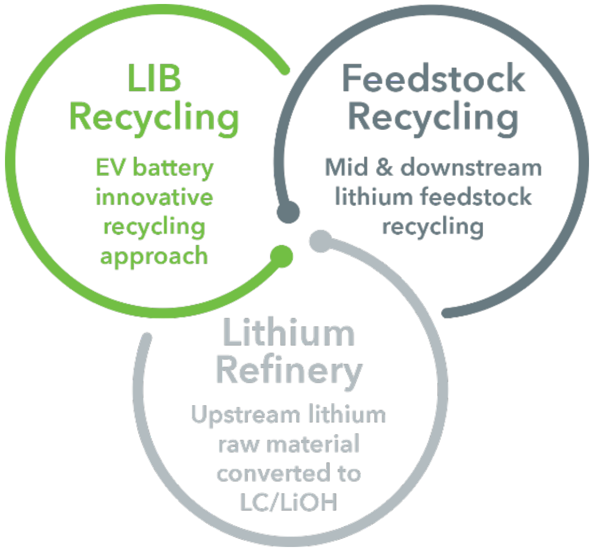
CONFIDENTIALITY AND FORWARD-LOOKING STATEMENTS

By accepting and reviewing this confidential presentation, you agree to maintain it confidential. The Company is a new start-up company with an unproven business plan, and any investors accept the high risks involved in a start-up including losing all of their investment. This presentation is not an offering document or memorandum and any investment will be accepted by the Company only pursuant to a binding subscription agreement that complies with applicable legislation.

Certain statements contained in this presentation may be considered "forward-looking statements" within the meaning of applicable Canadian securities laws. Forward-looking statements may generally be identified by the use of words such as "believe", "may", "will", "continue", "anticipate", "intend", "expect", "should", "would", "could", "plan", "potential", "future", "target" or other similar expressions that predict or indicate future events or trends or that are not statements of historical matters, although not all forward looking statements contain such identifying words. These statements are based on various assumptions, whether or not identified in this presentation, which the Company believes are reasonable in the circumstances. There can be no assurance that such estimates or assumptions will prove to be correct and, as a result, actual results or events may differ materially from expectations expressed in or implied by the forward-looking statements. Forward-looking statements involve inherent risks and uncertainties, most of which are difficult to predict and many of which are beyond the control of the Company, and are not guarantees of future performance. The Company believes that these risks and uncertainties include, but are not limited to, the following: inability to economically and efficiently source, recover and recycle lithium-ion batteries and lithium-ion battery manufacturing scrap, as well as third party lithium feedstock, and to meet the market demand for an environmentally sound, closed-loop solution for manufacturing waste and end-of-life lithium-ion batteries and other lithium feedstock; inability to successfully implement the growth strategy, on a timely basis or at all; inability to manage future growth effectively; inability to refurbish and scale up the Company’s processing plant and other future projects in a timely manner or on budget or that those projects will not meet expectations with respect to their productivity or the specifications of their end products; failure to materially increase recycling capacity and efficiency; failure of third-party technology that is part of the Company’s processing plant’s workings; the Company may engage in strategic transactions, including acquisitions, that could disrupt its business, cause dilution to its shareholders, reduce its financial resources, result in incurrence of debt, or prove not to be successful; one or more of its current or future facilities becoming inoperative, capacity constrained or if its operations are disrupted; additional funds required to meet capital requirements in the future not being available to the Company on commercially reasonable terms or at all when it needs them; the Company expects to incur significant expenses and may not achieve or sustain profitability; problems with the handling of lithium-ion battery cells that result in less usage of lithium-ion batteries or affect operations; inability to maintain and increase feedstock supply commitments as well as securing new customers and off-take agreements; a decline in the adoption rate of electric batteries particularly in electric vehicles, or a decline in the support by governments for "green" energy technologies; decreases in benchmark prices for the metals contained in the Company's products; changes in the volume or composition of feedstock materials processed at the Company’s processing plant or future plants (if any); the development of an alternative chemical make-up of lithium-ion batteries or battery alternatives; the Company requires customers and other sources of lithium feedstock; insurance may not cover all liabilities and damages; the Company is reliant on the experience and expertise of its management and technical team; reliance on third-party consultants for its regulatory compliance; inability to complete its recycling processes as quickly as future customers may require; inability to compete successfully against already established battery recycling companies; increases in income tax rates, changes in income tax laws or disagreements with tax authorities; significant variance in operating and financial results from period to period due to fluctuations in its operating costs and other factors; fluctuations in foreign currency exchange rates which could result in declines in future sales and net earnings (if any); unfavourable economic conditions, such as consequences of the global COVID-19 pandemic; natural disasters, unusually adverse weather, epidemic or pandemic outbreaks, boycotts and geo-political events; failure to protect its intellectual property and knowhow; the Company may be subject to intellectual property rights claims by third parties; failure to effectively remediate the material weaknesses in its internal control over financial reporting that it may identify or if it fails to develop and maintain a proper and effective internal control over financial reporting. Because of these risks, uncertainties and assumptions, and those contained in the Company’s public disclosure filings (which the reader should review carefully), readers should not place undue reliance on these forward-looking statements. Actual results could differ materially from those contained in any forward-looking statement. In addition, forward-looking statements contained in this communication reflect the Company’s expectations, plans or forecasts of future events and views as of the date of this presentation. The Company anticipates that subsequent events and developments could cause it's assessments, expectations, plans and forecasts to change. While the Company may elect to update these forward-looking statements at some point in the future, it has no intention and undertakes no obligation to do so, except as required by applicable laws. These forward-looking statements should not be relied upon as representing the Company's assessments as of any date subsequent to the date of this presentation. The Company's forward-looking statements are expressly qualified in their entirety by this cautionary statement.

FULL CIRCLE LITHIUM - OVERVIEW

"UPSTREAM" FEEDSTOCK: THREE LINES OF BUSINESS TO SOURCE FEEDSTOCK



"DOWNSTREAM" LITHIUM PROCESSING PLANT

3 business lines to fill plant capacity or to process feedstock at clients' site using modular plants with proprietary technology

UNIQUE EXPERTISE IN THE LITHIUM INDUSTRY

Experienced Lithium Management

- Capital markets know-how and proven lithium success (NLC/LAC)

Lithium Processing Plant, Georgia USA

- Fully permitted former producer
- Fully refurbished with up to 2kt/yr of LC capacity expandable to 10kt/yr LC
- Modular & easily expandable
- 5 EV and LIB giga-factories builds in vicinity
- >US$70B in EV/LIB investment regionally

Experienced Lithium Processing Engineers

- Over 70yrs of combined lithium processing
- Proprietary front-end lithium extraction process (LiP)
- Highly specialized know-how: operation/DLE/membrane
- Patent pending portfolio of lithium related technology

END PRODUCT & RESULTS

- Financing through capital markets, strategic partnerships
- Growth and value maximization M&A

- Complete suite of lithium compound production, starting with battery grade LC
- Potential for other battery materials (Cu, Al, Ni, Co, Gr, Mn)

- Potential for growth in larger upstream projects at client site (refinery business)
- Potential to license IP in certain applications and regions

WHY FULL CIRCLE LITHIUM?

US Based Operations and Fully Operational Plant

- Permitted downstream lithium carbonate processing plant in Georgia, USA – 20yr production track record
- Produced battery grade lithium carbonate (LC) from spent lithium-ion batteries (LIB) and other feedstock at pilot scale
- Plant has excellent infrastructure and room for expansion from up to 2,000t/yr capacity to 10,000t/yr LC
- Diversified upstream business with LIB recycling, midstream feedstock recycling and lithium refinery

Proven Processing and Green Footprint

- Conventional technologies being used throughout recycling/refinery process to recover lithium compounds and other battery materials for a complete recycling solution with carbon neutrality
- Starting larger scale demonstration of process utilizing a range of spent LIB types (40k lbs)
- Proprietary modular demonstration processing plant being completed for installation at client's plant for feedstock recycling
- Lithium refinery business line complements the business model and provides significant diversification and growth potential
- Patent pending portfolio of lithium technologies

Outstanding Market Dynamics

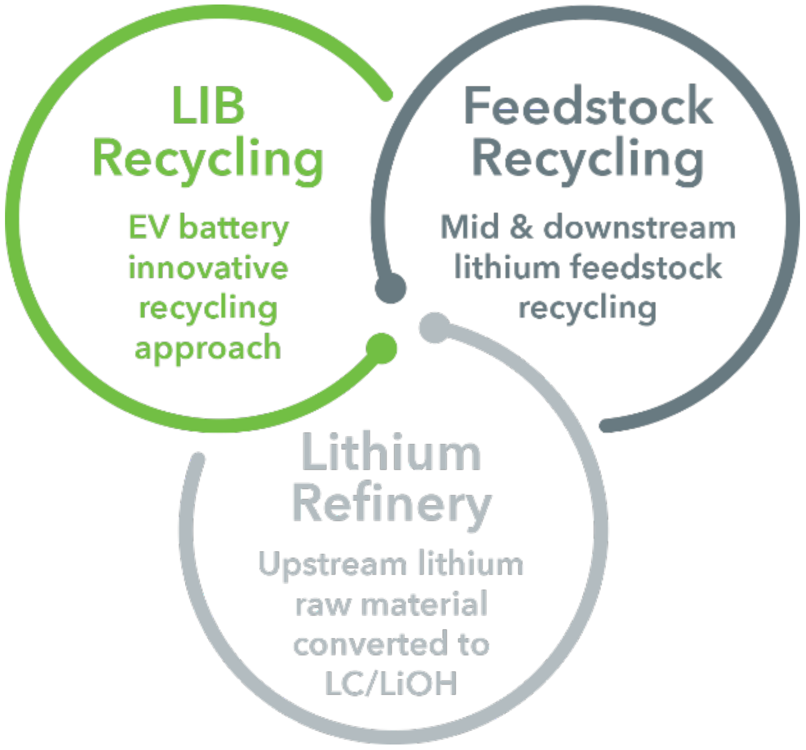
- Massive battery build-out worldwide and in North America (LIBs & scrap) with Electric Vehicle (EV) LIBs at the forefront needing end-of-life solutions
- Significant interest from midstream feedstock providers and refinery business for recycling and processing solutions
- Critical battery materials are in short supply and at all-time high price due to high demand

Proven Team & Support

- Leading technical expertise with +70yrs of combined experience in lithium processing (IP development ongoing)
- Proven lithium industry and capital markets experience
- Strong government support in Georgia with >100GWh of gigafactory build-out in the region

BUSINESS MODEL OVERVIEW

- Full-service battery metals processing company with a fully refurbished downstream LC plant with a capacity of 2kt per annum based in Georgia USA
    - Primary focus is on recycling lithium and other high purity battery materials
    - Proprietary front-end lithium extraction process (LiP) and back-end processing technologies know-how enhances and unlocks lithium recovery
    - All processes are modular and designed to be integrated into existing operations
    - Engineering expertise is focused on minimizing raw materials and waste (high recovery) with the lowest carbon intensity level possible
    - The process has been demonstrated at pilot scale on numerous industrial lithium byproduct streams and is efficient, continuous and cost competitive
- Our upstream business segments (LIB recycling/midstream feedstock recycling/lithium refinery) can provide feedstock to our downstream LC plant or simply provide other lithium compounds directly to end-users
    - The plant can take different lithium feedstock (lithium chloride/sulphate) and produce battery grade LC
    - LIB recycling in advance stages of demonstration and focused on mitigating the three process safety risks: discharge of batteries, hydrogen/heat generation and fluoride process/recovery
    - Midstream feedstock recycling demo plant installation in Q2-Q3 2023
    - Lithium refinery in initial stages of development and end-user discussions



OUR TEAM

Carlos Vicens

CEO, Director & Founder

- Mr. Vicens has over 25 years of years of global experience in capital markets, corporate development, strategy and investment banking including M&A and corporate finance.
- He previously worked as Vice-President in well known Canadian investment banking mining team and participated in over $10B of M&A transactions and well over $5B in equity and debt issuances.
- Over 10 years of hands-on C-level experience in the lithium sector, including his previous CFO position.

Paul Fornazzari

Non-Executive Chairman

- Mr Fornazzari has over 30 years of global law experience in a number of industries focusing on capital markets and merger and acquisitions practice.
- Founding Chairman of Lithium Americas Corp. and founding director of Neo Lithium Inc.
- Partner at a Canadian law firm.

Thomas Currin

COO & Founder

- Mr Currin has 40 years of lithium chemical production and process engineering experience, including Dupont and Livent.
- In 2016 Mr. Currin's engineering team received the Outstanding Partnership Regional Award by the Federal Laboratory Consortium for Technology Transfer.
- His strong relation the US Federal Laboratories places him at the forefront of developing innovative process technology in the renewable energy and lithium battery industry.

Dr. Bill Bourcier

CTO & Founder

- Mr. Bourcier has worked and consulted with Lawrence Livermore National Laboratory (LLNL) for the last 35 years.
- He has over 20 patents and 50 publications resulting including a licensed patent for a process using reverse osmosis to produce marketable silica from geothermal waters.
- In 2008 he left LLNL to co-found Simbol Mining, a company focused on extracting lithium from geothermal brines.

.

Franco Mignacco

Director

- Mr. Mignacco has a comprehensive understanding of the global lithium business. He is the President of Minera Exar S.A., the operator of the Cauchari Olaroz lithium brine project co-owned by Lithium Americas Corp. and Ganfeng Lithium Co., Ltd.
- In this current role Mr. Mignacco is leading the buildout of one of the largest lithium brine projects in the world including construction of the lithium processing facilities for the project. He was the co-founder of Lithium Americas and a director since 2010.

Mike Cosic

Director

- Mr. Cosic is a strategic executive with 30 years of achievement in a variety of industries, including lithium, where he was the CFO of Lithium Americas Corp. when the company merged with Western Lithium to create an industry leading lithium resource company.
- Mr. Cosic has been a public company CFO, a public company CEO, and the audit committee chair for a TSX listed company.
- He has extensive experience in obtaining financing for early-stage companies.

Orlee Wertheim

Director

- Ms. Wertheim started her career as a corporate lawyer, where she acted for both domestic and international public companies. Using this experience, she joined the TSX's Listed Issuer Services department.
- Ms. Wertheim was responsible for the development and execution TSX's global strategy for attracting new listings in the mining sector.
- Most recently, she acted as Capital Markets Counsel at a major Canadian law firm.

SCALABLE OPERATIONAL PLANT

Downstream Processing LC Plant

- Plant has up to 2,000 t/yr LC capacity with ability to expand to up to 10,000 t/yr LC
  - Capacity to process lithium sulphate/lithium chloride streams and can also process multiple 3rd party industrial/mining streams
  - The plant is currently leased with an option to purchase 100% for US$500k
  - Portfolio of patent pending lithium technology

Feedstock Sourcing – Three Diversified Business Lines

Midstream Feedstock Recycling – no longer a science experiment

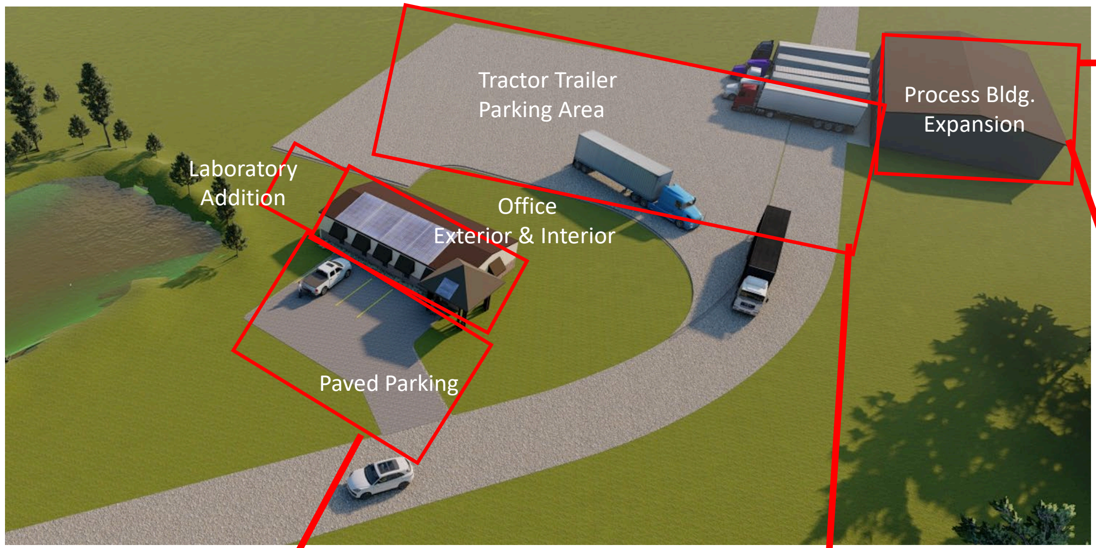
- Potential to use Georgia plant or instal proprietary modular plant at client site
- Completed lab and pilot scale processing of multinational client's lithium feedstock and installing propriety modular demo processing plant at client's chemical plant
- Analyzing and pilot testing other lithium streams

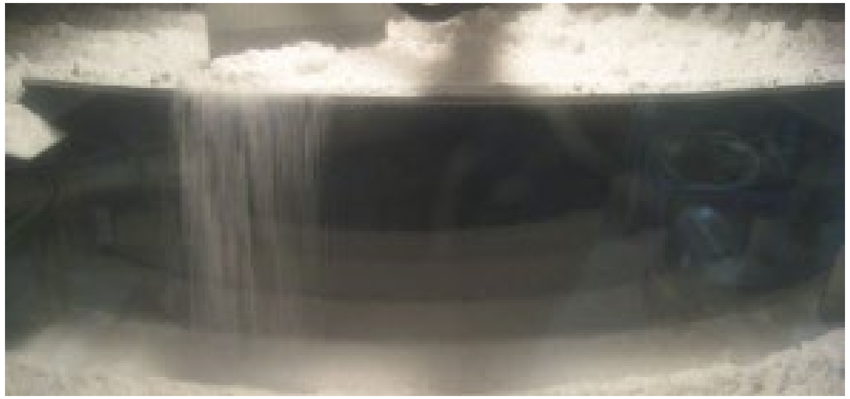
LIB Recycling

- Team has disassembled spent LIBs and successfully produced LC at the plant
- Larger scale demonstration work ongoing to demonstrate large scale processing and economics, as well as optimize/automate disassembly methods for final LC extraction process

Lithium Refinery – numerous discussion on-going for processing

PLANT REFURBISHMENT PHASE 1





SUMMARY

ROAD TO VALUE CREATION

PILOT PLANT, DEMONSTRATION & R&D

1994-2012

Historic ~US$5M

- Proven and tested and fully operational processing plant in Nahunta, Georgia
- Over a period of 18 years had >15 engineering contracts and produced more than 20t of battery grade LC
- Mothballed in 2012 due to deteriorating market conditions

DEMONSTRATION & REOPENING OF PLANT

2019-2023

Completed C$5M

- Proof of concept on battery recycling completed in 2019/20, ongoing process optimization on different types of LiBs (Sourced 40k lbs of LIBs)
- Modified plant process flow sheet completed for quick restart
- Discussions with a number of companies with respect to midstream feedstock recycling business
- LiP technology in place - IP development ongoing

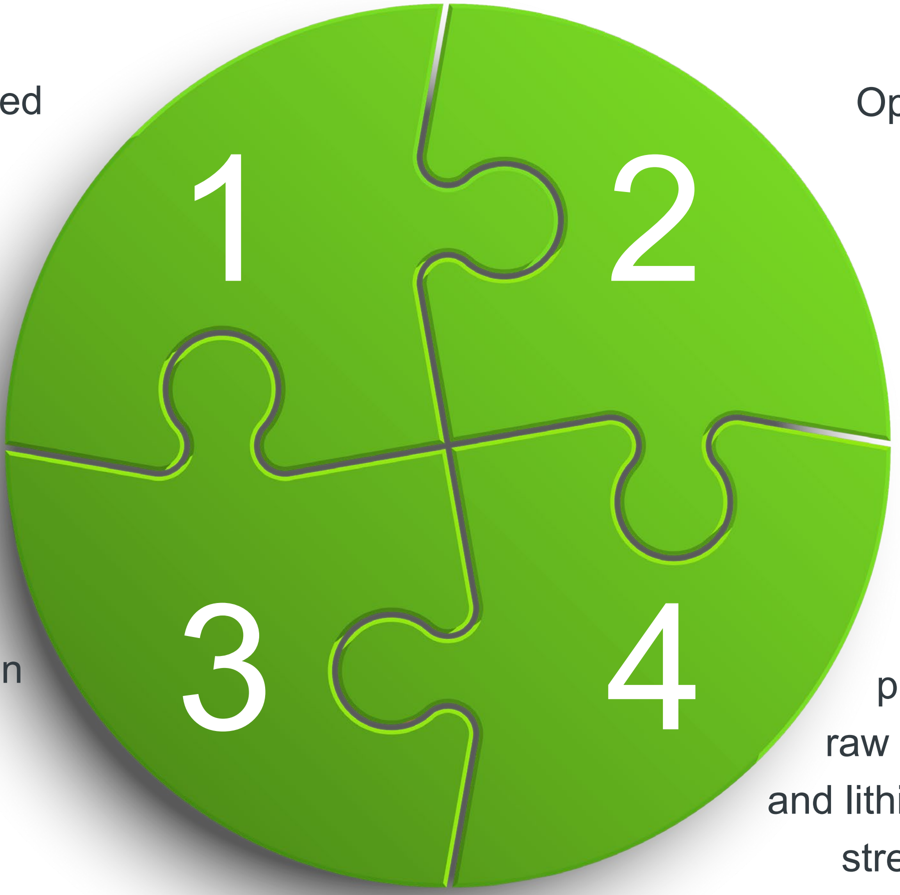
COMMERCIALIZATION & REVENUE GENERATION

+2023

Future

- C$10M funding concurrently with TSXV go-public transaction
- No additional funds expected to be needed for initial revenue generation – for midstream feedstock recycling business and LIB recycling
- Continued focus on spend LIB sourcing for recycling and lithium refinery business
- Additional growth not funded, expected to come from: (a) plant expansion: up to10kt LCE, (b) additional midstream feedstock recycling and lithium refinery deals, and (c) selective and strategic JV/M&A

SUMMARY



Highly experienced technical and lithium industry management team

Operational plant with a 20 year track record of LC production

Diversified business profile in a fast-growing global lithium recycling processing industry

Proven processing from raw material (LIBs) and lithium by-product streams to battery grade LC or other lithium compounds

CAPITAL STRUCTURE*

68.3	C$0.70	C$48M
Issued & Outstanding Shares	Share Price (TSXV:FCLI)	Market Capitalization
81.4	~C$9.5M (no debt)	~32%
F.D. Outstanding Shares	Net Cash	Insider Ownership (Mgmt/BoD)

* As at the date of go-public estimated to be May 1, 2023

- Only a few comparables to FCL trade publicly or have estimated valuations
  - Li-Cycle US$900M, American Battery Technology US$500M, Aqua Metals US$100M, Electra Battery Materials C$90M and RecycliCo C$120M, as well as Redwood Materials (Private) ~$3.5B
  - Other battery recyclers in North America include: Cirba Solutions, Neometals, Lithion, Electra Battery, Ascend
  - There are many companies in the LIB recycling business, each with its own processing differentiator (mostly not proven)
- Most if not all comparables are only focused on recycling of long lead time end of life LIBs
- No other public or private company has the strategy of recycling both LIBs and midstream feedstock, as well as pursuing lithium refinery

CARLOS VICENS
FULL CIRCLE LITHIUM CORP.
CEO & DIRECTOR

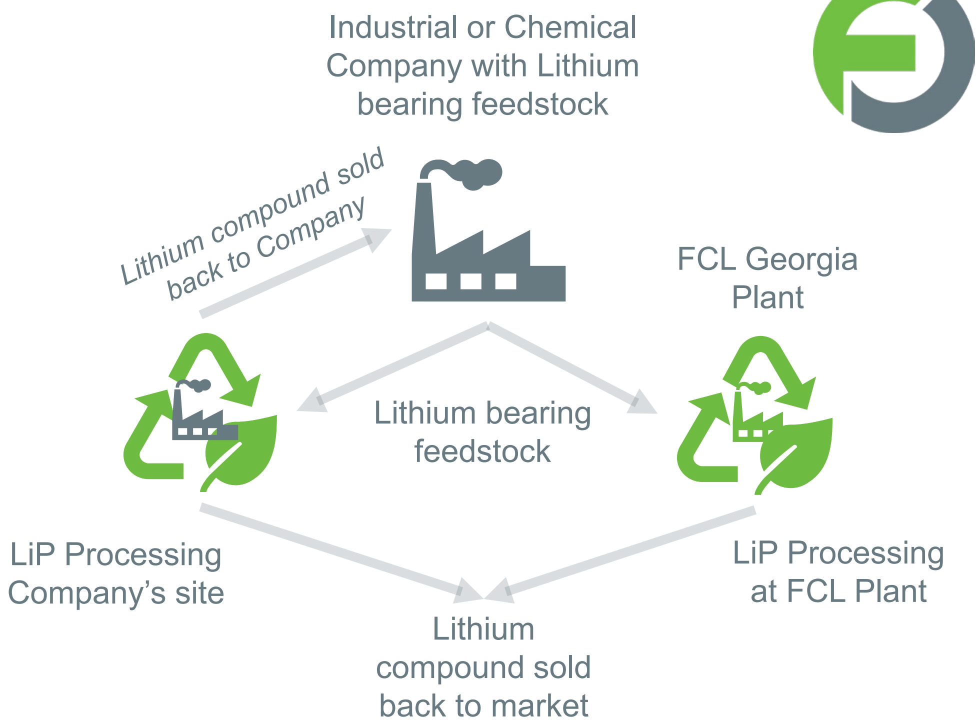
CVICENS@FULLCIRCLELITHIUM.COM

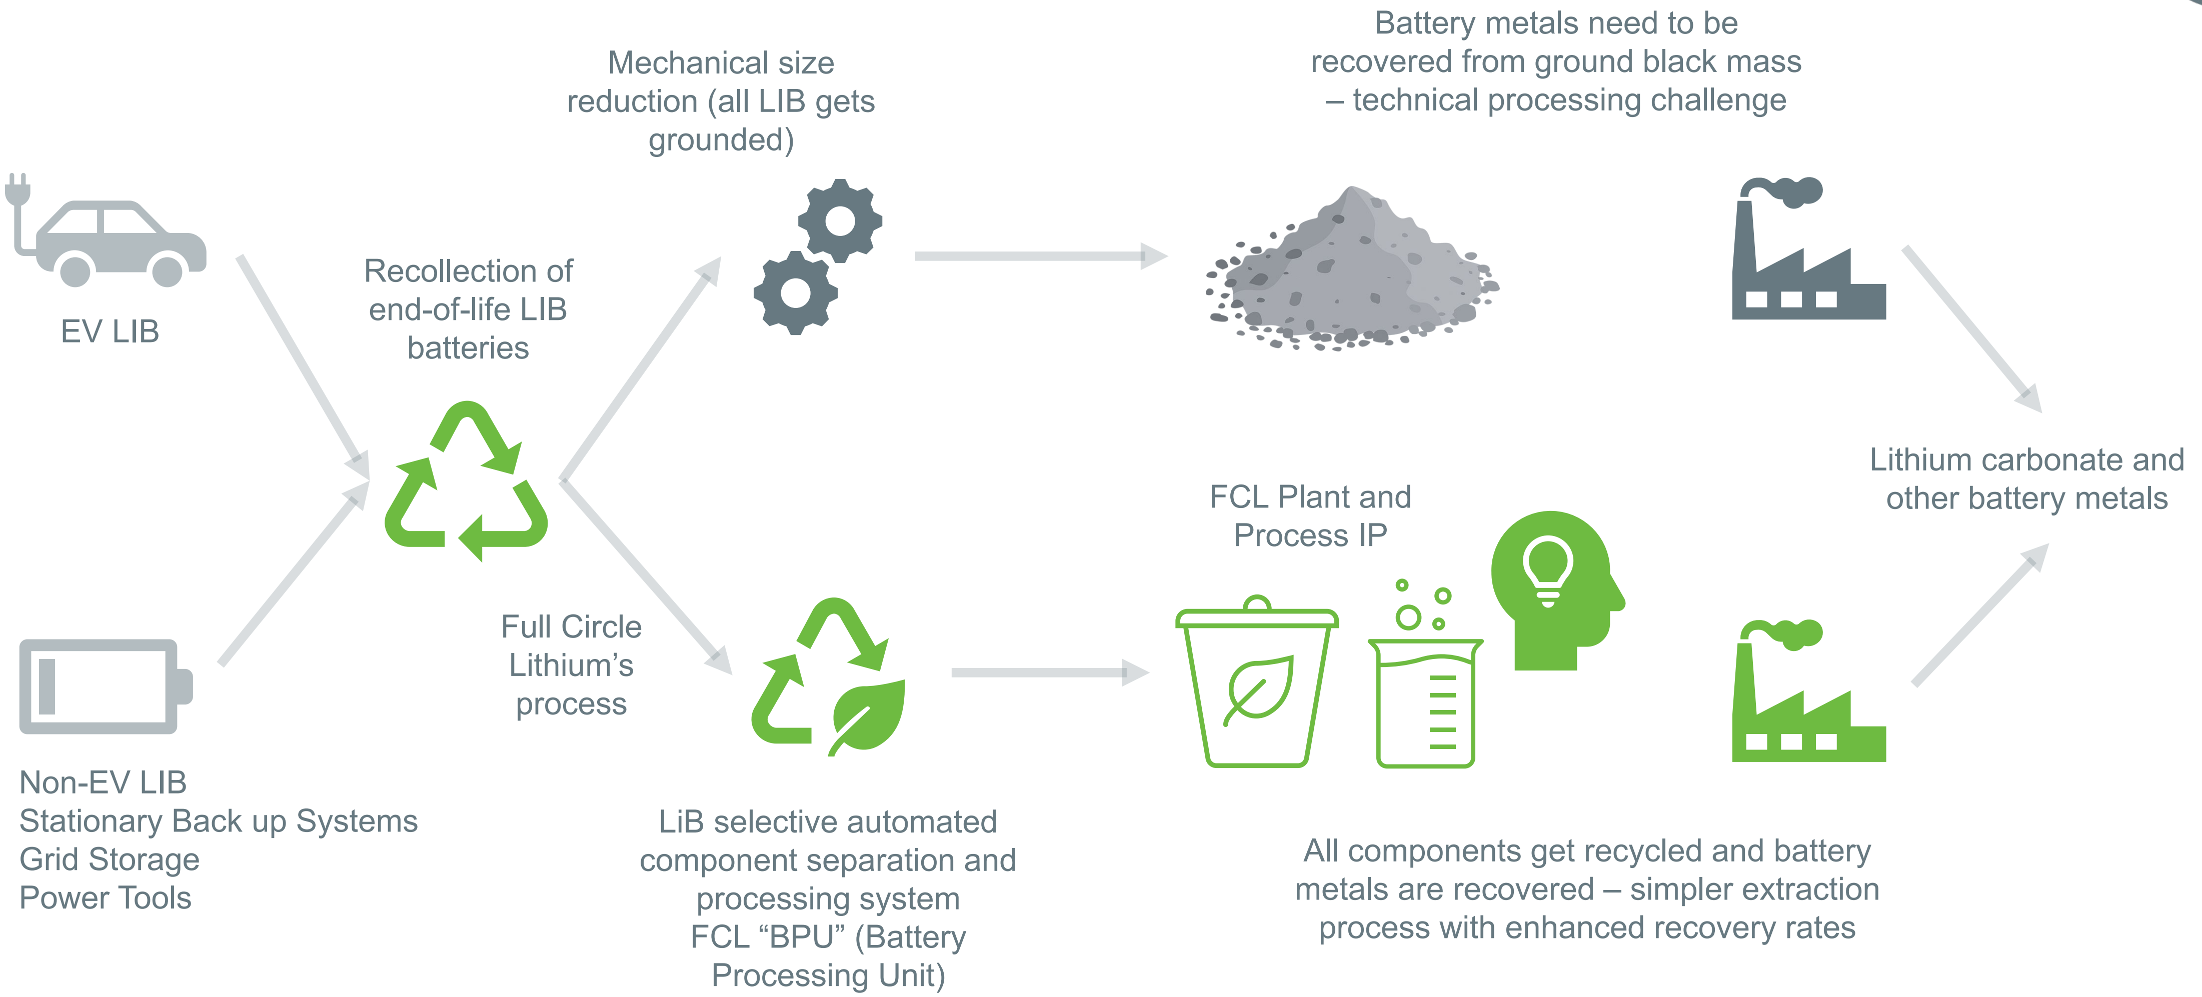
BUSINESS OVERVIEW

MIDSTREAM FEEDSTOCK RECYCLING

- Significant interest from third party chemical and manufacturing companies that utilize lithium chemicals in their primary processes (to make other valuable chemical compounds) and have residual lithium bearing streams or waste
- FCL is working with a major chemical company with a term sheet in place
  - Following successful lab and pilot work using proprietary technology, a demo plant is being built and installation to occur by end of Q2 early Q3 2023
  - 6-8 week demonstration phase, which if successful, and subject to final agreement, will lead to proprietary modular commercial production plant build-out
- Currently in discussion with a number of other specialty chemical companies
- A typical process would entail:
  - Analyzing third-party lithium stream for lithium content and impurities at FCLs facilities
  - Using FCL's proprietary lithium extraction technologies (LiP) and know-how to demonstrate extraction and purification of lithium chemicals at the Georgia plant
  - Demonstrate win-win economics for both parties
  - Build processing capability to extract lithium into a range of desired lithium compounds (lithium extraction and processing can occur at FCL's plant or modular plant can be installed at client site)
- There is significant growth potential in this business segment given limited lithium supply, rising cost of lithium chemicals from few suppliers, and limited processing know-how



END OF LIFE LIB RECYCLING (LFP FOCUSED)



Focused on mitigating the three process safety risks of LIB recycling: discharge of batteries, hydrogen/heat generation and fluoride process/recovery

LITHIUM REFINERY

- There is significant interest in lithium chemical extraction and processing expertise from upstream development stage mining companies (brines, clays, hard-rock, geo-brines and petro-brines) and most lack LC expertise and/or do have a pilot or plant
- The lithium mining industry is starting to realized that extraction and processing of the lithium is highly complex and very particular to the chemistry of each project, however once lithium sulfate or lithium chloride is produced the process is well understood
    - The FCL team has produced lithium precursor from brines, clays, hard-rock and petro-brines and saleable lithium chemicals for over four decades
    - FCL’s plant can act as a pilot and/or full commercial processing plant for US based projects that want to tap into FCL’s expertise and save significant time and money in developing their own such plants and expertise
- There are few lithium refineries in the USA and capacity is limited, prices of lithium products have generally increased over the past two years and are harder to secure from USA producers – Albemarle and Livent
- There is a need for new, nimble and adaptive lithium chemical processing companies that can meet the growing need for processing various feedstock and/or precursor raw lithium concentrates and supply the market with battery grade lithium

ADDITIONAL INFORMATION

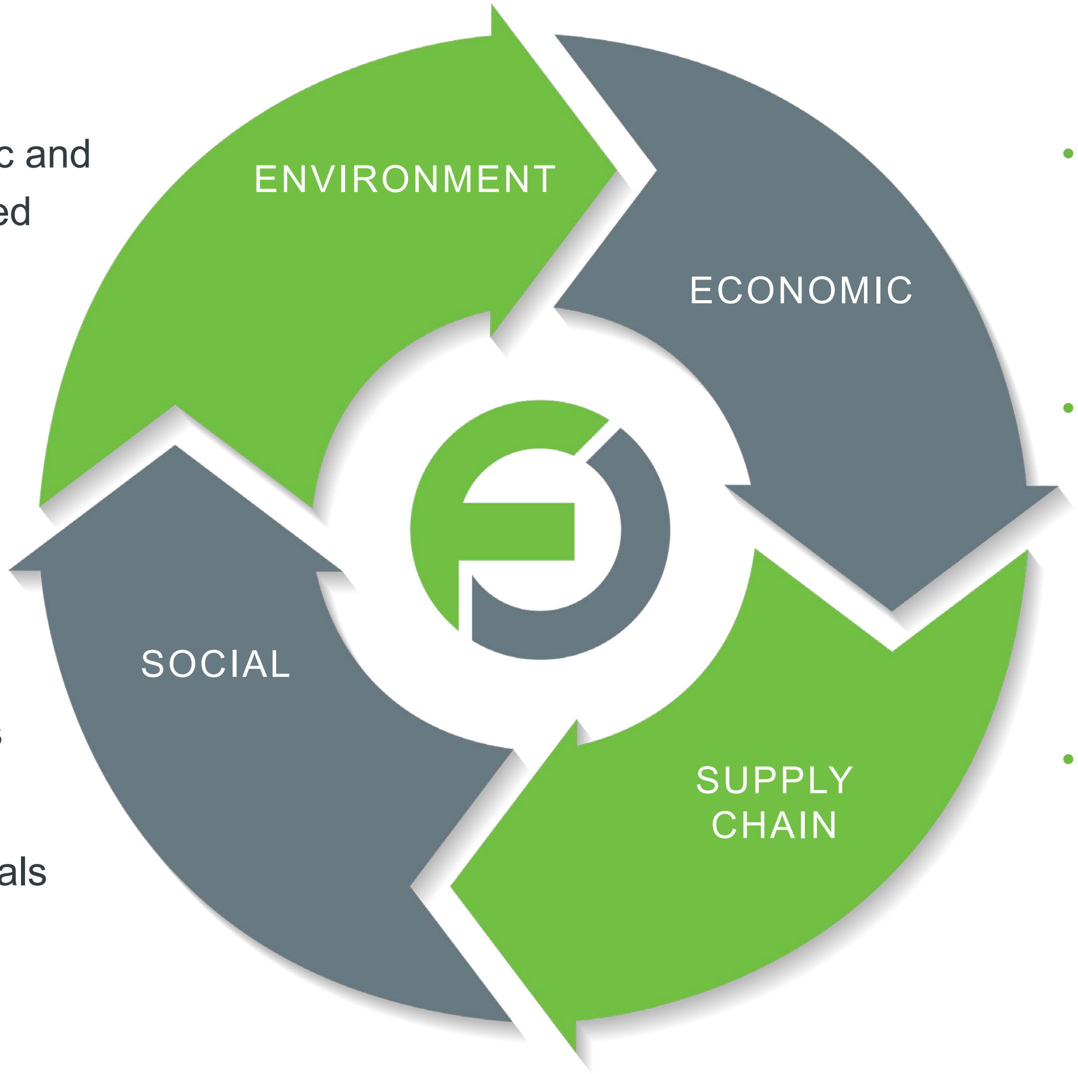
GEORGIA – PRIME LITHIUM PROCESSING REAL ESTATE

- Electric Mobility Manufacturing
  - In Georgia alone EV-related projects have surpassed US$20B with OEM's such as Hyundai Motor Group & Rivian, battery suppliers such as SK Battery and Freyr, as well as other supply chain enablers which include battery recyclers Ascend Elements and SungEel Recycling
  - Other include:, Aspen Aerogels, Aurubis, Caterpillar, Club Car, Cimbar Performance Minerals, Denkai, Dongwon Tech, Duckyang America, EnChem Ltd., EcoPro, Energy Assurance GEDIA, JCB, Kirchoff, Heliox, Plug Power, TEKLAS, Textron, Wonbang Tech, Yamaha Motor Manufacturing
- Strong Workforce
  - State-sponsored training facilities, high-end education programs, and nationally ranked colleges provide Georgia businesses with talent to achieve success
- Supportive consumer adoption of EVs and electrification
  - Public and private entities are offering incentives and suggesting policies to support continued growth of the electric mobility sector (Electric Vehicle Supply Equipment Tax Credit & $250 Georgia Power rebate program)
  - Georgia is 6th in the nation for public EV charging stations, offering more than 1,500 individual outlets, equating to more outlets per capita than anywhere in the Southeast
  - The State of Georgia is focused on the future of electrification

THE CASE FOR RECYCLING

- Spent LIBs can be toxic and hazardous if not handled properly
- Reduction in GHG emissions

- Profitable recovery of valuable battery metals – lithium, cobalt, graphite, copper, nickel
- Employment creation



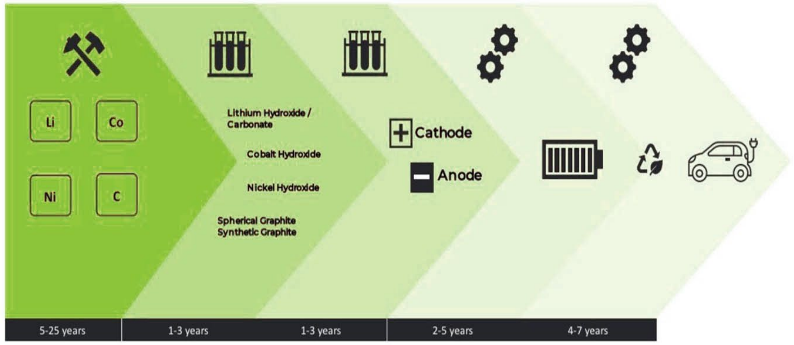
- Recovery of critical materials increases supply of raw materials
- Reduced reliance on imported critical materials

- Reduction in negative local impacts from mining and refining

THE CASE FOR RECYCLING

- Insufficient investment in raw materials to meet demand, expected to last for the foreseeable future
- Raw material prices are currently at all time highs due to supply/demand fundamentals
- The LIB supply chain is complicated and long
- Battery prices are starting to reflect higher raw material prices
- Additional supply, i.e. recycling, will not fix the problem but it can alleviate and be profitable

THE LITHIUM ION BATTERY AND ELECTRIC VEHICLE SUPPLY CHAIN IS A **LONG ROAD**



THE GREAT RAW MATERIAL DISCONNECT: IT TAKES MUCH LONGER TO BUILD A RAW MATERIAL PROJECT THAN A BATTERY OR CAR PLANT

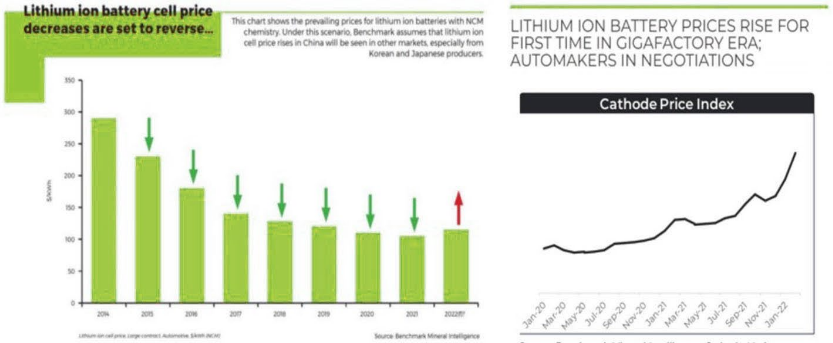
SUPPLY CHAIN IMPACT: ...MEAN **RISING BATTERY COSTS**



Source: Benchmark Mineral Intelligence Cathode Market Assessment March 2022

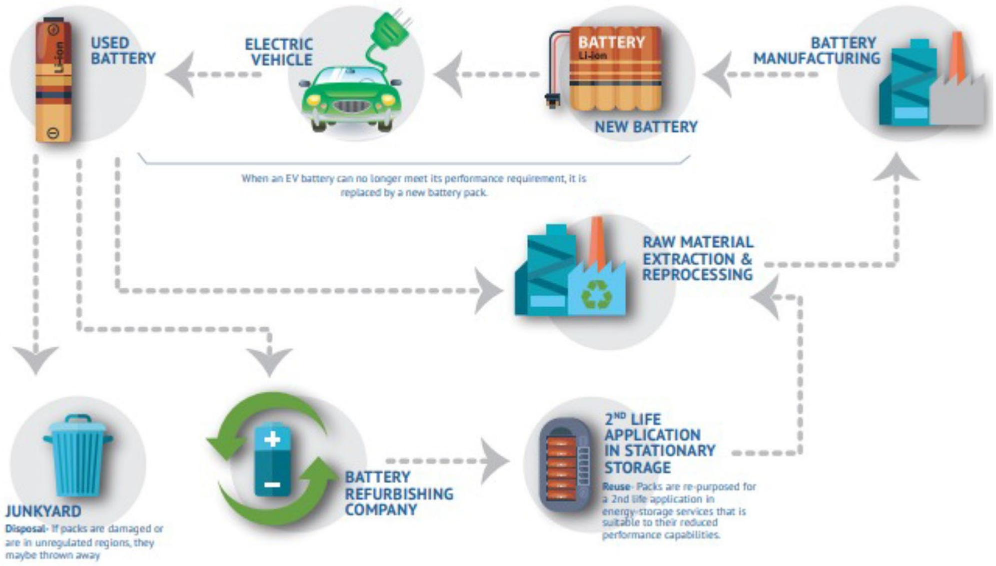
THE MARKET – LITHIUM-ION BATTERY (LIB)

Enormous Battery Build Out Planned

- LIB recycling will be key with over 5.4TWh of battery production planned worldwide by 2031 (source BMI)
  - +US$430B to be invested in gigafactories (US 700GWh, Europe 850GWh and China 3.7TWh)
  - Typical size of LIB expected to be 60-70kWh
  - 1TWh could build +15M electric vehicles per year
  - Over the next decade there will significant LIB rollout
- US based battery makers require a recycling solution
  - >100GWh of gigafactory build-out in FCL's region –
    (Ford, Hyundai, Rivian, GM, Stellantis, Toyota, VW, SK Energy, LG Chem, Samsung)

LIB Lifecycle & Others

- BloombergNEF predicts 5Mt of end-of-life batteries will be available for recycling in 2035, enough material to support 15%-30% of the key metals used for battery manufacturing in that year
- EV and stationary storage projects will reach the end of their initial life after operating for roughly 8-12 years.
- LIB manufacturing today has ~10-30% raw material scrap
  - Significant potential to reprocess battery materials
- Non EV batteries are another market potential (i.e. power storage and electronics)



LITHIUM-ION BATTERY (LIB)

- Almost two thirds of the cost of an average LIB is composed of the cathode/anode where most battery critical raw materials are located
- Cathode material is the most important segment of the LIB, while lithium is the key component for all LIBs
- Depending on the formulation and type of the LIB (LFP, NCA, NMC) lithium, nickel, cobalt, manganese and graphite are important valuable elements
- Average cost of a typical electric vehicle (EV) LIB is US$6,000 to US$7,000 based on 2021avg cost of $101kWh
    - Continued price pressure on raw materials over the past months have increased the price of the battery to >$200kWh
- In addition, Gigafactories produce large amounts of raw material scrap of Cathodes and Anodes
